This page covers topology as a field of mathematics. For topology as a structure on a set, see topological space. Parts of this page also exist in a German language version, see Topologie. I think we miss another correctly geometric or linear analysis that expresses the position directly while the algebra expresses greatness. G. W. Leibniz (lettra a Huygens 1679, according to Bredon 93, p. 430) Topology of the idea is one of the basic fields of mathematics. The term is also used for a particular structure in a topological space: See the topological structure for this. The topic of the topology deals with the expressions of continuity and boundary and study the geometric properties of spaces (originally: metric) and subspace relationships, which do not change in continuous deformations, regardless of others (as in their metric properties). Topology as a structure allows to model continuity and convergence locally. More recently, in the metric spaces, topologists and theorists of the geometric group have begun to examine asymptotic properties in general, which are somehow double to the standard topological structure and are usually called coarse topology. There are many cousins of the concept of topological spaces, e.g. Sites, premises, mouses, higher mouses, uniformity spaces and so on, who specialize or generalize some aspects or structures usually present at the top. One of the tools of topology, homotopia theory, has long crossed the boundaries of topology and applies to many other areas, thanks to many examples and motivations, as well as abstract categorical pictures for homotopia like the categories of Quillen models, the Brown categories of fiber objects and so on. INTRODUCTION The following provides a rapid introduction to some of the main concepts and tools of topology:detailed to the introduction to the topology. Continuing the key idea of topology is to study spaces with "continues" continues between them. The concept of continuity was first made precise in analysis, in terms of epsilonic analysis of open balls, recalled as Def. under. So it was realized that this has a more elegant formulation in terms of more general concept of open sets, this is prop. Below. The adoption of the latter as a definition leads to the concept of topological spaces, Def. under. First recalls the basic concepts from the analysis: (metric space) a metric space is such that for all $x, y, z \in X, y, z \in X: d(x, y) = 0 \Leftrightarrow x = y$ (symmetry) $d(x, y) = d(y, x)$ $d(x, y) = d(y, x)$ (triangular inequality) $d(x, y) + d(y, z) \geq d(x, z)$. Each nore vector space $(V, \langle \cdot, \cdot \rangle)$ becomes a metric space according to Def. Setting $d(x, y) = \sqrt{\langle x - y, x - y \rangle}$. $d(x, y) \leq \epsilon \Rightarrow \exists \delta > 0$ such that $d(x, y) < \delta \Rightarrow d(x, y) < \epsilon$ (Definition of continuity) for (x, d_x) and (y, d_y) two metric spaces (def.). Therefore a function $f: X \rightarrow Y$ is said that it is continuous in a point $x_0 \in X$ if for each $\epsilon > 0$ exists $\delta > 0$ such that $d(x, x_0) < \delta \Rightarrow d(f(x), f(x_0)) < \epsilon$.
